Moving Average Crossover: After graphing, two moving averages based on separate time periods tend to cross, which is known as a moving-average crossover [6]. A quicker moving average and a slower moving average are used in this indication (or more). The shorter moving average (short-term) [3] can be 5, 10, or 15 days, while the longer-term moving [1, 2] average might be 100, 200, or 250 days. Since it only evaluates prices over a short period of time, a short-term moving average is speedier and more responsive to daily price changes [2, 4, 5]
